TAC (Triacetate cellulose) film, namely triacetate cellulose film, is a film obtained by dissolving, filtering, plasticizing, injection molding, drying and other processes of powdered TAC particles. It has excellent light uniformity, transparency, and durability. Acid-base and UV resistance. The TAC film used in the production of polarizers has extremely high quality requirements. It is required to control various parameters of the production process to make the final product achieve higher flatness, excellent mechanical properties and optical properties, and the ability to control the process during the entire production process Very demanding. At present, the commonly used TAC film thickness specifications on the market are 40?m, 50?m, 57?m, 80?m, etc., among which 50?m and 80?m specifications are the most mainstream. The TAC films used in the production of polarizers can be roughly divided into two categories, namely, light plate TAC film (applied to the inner layer of the polarizer), and TAC functional film (applied to the outermost layer of the polarizer). The light plate TAC film refers to the TAC base film without any surface treatment or additional film layer, and the TAC functional film refers to the TAC film with different functions after being processed by surface treatment methods such as coating and sputtering. According to the final use purpose, common surface treatment methods include: anti-glare treatment (AG), anti-glare + low reflection treatment (AG+LR), transparent hardening + low reflection treatment (CHC+LR), transparent hardening treatment (CHC), anti-reflection treatment (AR) etc. Different surface treatment methods can meet the application requirements of different terminals. For example, CHC treatment is mostly used on touchable mobile electronic devices.
