TACE embolic microspheres are a type of microsphere embolic agent used in transcatheter arterial chemoembolization (TACE) therapy. TACE stands for Transarterial Chemoembolization, which is a medical procedure used primarily in the treatment of liver cancer. It involves delivering chemotherapy drugs directly to a tumor in the liver while also blocking the blood supply to the tumor. This dual action helps to both directly attack the cancer cells and cut off their blood supply, thereby shrinking or slowing the tumor's growth. TACE embolic microspheres can be loaded with chemotherapy drugs (such as doxorubicin) or used alone to embolize (block) the blood vessels. By blocking these vessels, the microspheres prevent the tumor from receiving oxygen and nutrients, thereby reducing its ability to grow and survive.

The global TACE Embolic Microspheres market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
