Tackifiers are low-molecular weight compounds (oligomers) that are added to adhesive formulations to improve tack and peel adhesion. Their glass transition temperature (T_g) is typically higher than that of the base polymer but their molecular weight is much lower. The tackifiers dissolve in the polymer matrix and break up their structure and thereby enhance the mobility and tack of the base polymer. They also provide functionality that promotes specific adhesion, bridging and reduces molecular cohesion, which in turn, lowers the melt viscosity and softening point of the polymer system.
