## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Tallow fatty acids are a family of fatty acids derived mainly from animal fat, more particularly of bovine origin. These acids are a mixture of saturated fatty acids (as myristic, palmitic and stearic) and unsaturated (such as palmitoleic, oleic and linoleic).

Such acids can be marketed retaining the same fatty acid distribution of tallow, or can be performed prior to distillation partial hydrogenation that increases the stability of the product. Depending on their use and application we will opt for one or the other.
