The global Tannin Blockers market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

Tannin blockers are substances or compounds used to inhibit or reduce the effects of tannins. Tannins are naturally occurring compounds found in various plant-based materials such as fruits, vegetables, bark, and wood. They are known for their astringent properties and can interact with proteins, enzymes, and other substances, causing undesirable effects in certain applications.

Tannin blockers work by binding to tannins and forming complexes, preventing them from interacting with other compounds or causing unwanted reactions. They can be added to products or processes to mitigate the negative effects of tannins and improve the overall quality or performance. Tannin blockers are commonly used in industries such as food and beverages, winemaking, leather processing, wood preservation, and pharmaceuticals.
