Tanning machines provide natural color to the skin and works on the tanned or burnt skin. Brown pigmented skin that is caused due to excessive exposure to sunlight is revitalized into a new or same shade of tanned skin after using tanning machines. Spray tanning machines are used to get a natural-looking shade of tan by spraying a mist on the specified areas of skin. The chemical involved in the process is Dihydroxyacetone (DHA), where the colorless chemical interacts with amino acids which naturally occur in skin cells. The contact between chemicals and natural skin amino acids provides several darker shades to skin, eliminating tan. Apart from spraying mist on the tanned skin, tanning beds emit ultraviolet radiation to produce a cosmetic tan and removes discoloration. A brownish pigment called "melanin" is produced by ultraviolet rays stimulating melanocytes. Melanin protects the skin from burning. Tanning machines overall helps in providing several shades of tan to tanned skin.
