The global Tanning Material market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Tanning is a natural or processed substance that has the property of turning raw hides into leather. The basic principle is to use tannins to combine with the active groups of leather collagen to generate new cross-links between adjacent peptide chains and molecules of collagen molecules, thereby strengthening the structural stability of collagen and improving the bending resistance and strength of leather. Resistance to chemical agents and microorganisms also greatly increases the shrinkage temperature of collagen and enhances the stability of collagen with respect to heat and humidity.

United States market for Tanning Material is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Tanning Material is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
