A tape extruder is a machine used in manufacturing processes to produce various types of tapes, such as adhesive tapes, packaging tapes, or even specialty tapes like medical tapes or electrical tapes. The extruder takes raw materials, typically in the form of plastic pellets or resin, and melts them down to a molten state. This molten plastic is then forced through a die, which shapes it into the desired form of tape, be it flat, wide, narrow, or with specific textures. Once extruded, the tape is cooled and solidified before being wound onto spools or rolls for further processing or packaging. Tape extruders come in different sizes and configurations depending on the specific requirements of the tape being produced and the volume of production needed. They can be part of a larger tape manufacturing line or operated as standalone machines.

The global Tape Extruder market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
