A Taptite screw is a high-performance screw that does not require a female thread. A similar screw is called a tapping screw, but its shape and characteristics are different. A normal screw consists of a bolt, called a male thread, and a nut, called a female thread. Both of these threads are combined to fasten the screw. However, a Taptite screw does not require a female thread. Because of its shape, it can be fastened directly to the mating side by applying a female thread when tightening.

The global Taptite Screws market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
