Abstracts

According to this study, the global Targeted Bisulfite Sequencing Service market size will reach US\$ 1015 million by 2031.

Targeted Bisulfite Sequencing Service is an epigenetic analysis method that combines bisulfite conversion with next-generation sequencing (NGS) to detect DNA methylation at single-base resolution within specific genomic regions. During bisulfite treatment, unmethylated cytosines are converted to uracil, while methylated cytosines remain unchanged. The converted DNA is then PCR-amplified and sequenced, enabling precise methylation profiling of targeted loci. Compared to whole-genome bisulfite sequencing, the targeted approach offers cost-efficiency, higher coverage depth, and focused data output. This service is widely used in biomarker validation, early cancer detection, developmental biology, and disease mechanism studies, providing a powerful tool for high-resolution, site-specific DNA methylation analysis.

United States market for Targeted Bisulfite Sequencing Service is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
