Leukemia is a malignant clonal disease of hematopoietic stem cells. According to the degree of differentiation and maturity of leukemia cells and the natural history of the disease, leukemia is divided into two categories: acute leukemia (AL) and chronic leukemia (CL). Secondly, AL can be divided into acute lymphoblastic leukemia (ALL) and acute myeloid leukemia (AML) based on the mainly affected cell series. CL is divided into chronic lymphocytic leukemia (CLL), chronic myelogenous leukemia (CML, also known as chronic myelogenous leukemia) and rare types of leukemia. In the past decade or so, targeted drugs have made many breakthrough achievements in the clinical treatment of leukemia.

Targeted drugs for leukemia are a class of medications designed to specifically target and attack cancer cells while minimizing damage to healthy cells. These drugs work by interfering with specific molecules or pathways that are involved in the growth and survival of leukemia cells. One example of a targeted drug for leukemia is imatinib (Gleevec), which is used to treat chronic myeloid leukemia (CML) by inhibiting the activity of the BCR-ABL protein, a key driver of leukemia cell growth. Other targeted drugs, such as dasatinib, nilotinib, and ponatinib, also target the BCR-ABL protein but may be used in cases of resistance or intolerance to imatinib. Additionally, newer targeted therapies, such as venetoclax and midostaurin, target other specific molecules or pathways involved in leukemia cell proliferation, providing more treatment options for patients with different types of leukemia. Targeted drugs have revolutionized the treatment landscape for leukemia, offering improved efficacy and reduced toxicity compared to traditional chemotherapy.

As a new trend in the treatment of leukemia, gene-targeted drugs will see more research and development in the future. Although this drug still has some problems, such as high price, drug resistance, etc., with the continuous advancement of science and technology and the continuous progress of medicine, it is believed that gene-targeted drugs will become an important means of treating leukemia.

The global Targeted Drug for Leukemia market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.

Leukemia occurs most often in adults older than 55 years, but it is the most common cancer in children younger than 15 years. Among adults, the most common types are CLL (35%) and AML (32%). Among children and teens, ALL is the most common, accounting for 75% of pediatric leukemia cases.

Globally, an estimated 440,000 new cases of leukemia are diagnosed each year along

with 310,000 deaths. There will be an estimated 60,000 new cases of leukemia in the United States in 2023, and more than 24,000 related deaths. Survival rates vary substantially by leukemia subtype, ranging from a current five-year relative survival rate of 27% for adults diagnosed with AML to 86% for those with CLL, and 66% for children, adolescents, and young adults diagnosed with AML to 92% for those with ALL. In 2018, there are an estimated 381,774 people living with or in remission from leukemia in the United States. As the burden of leukemia grows, there will be a corresponding increase in the demand for effective treatment options, including targeted drugs.

The development of targeted drugs has transformed the treatment landscape for leukemia, offering improved efficacy and safety compared to traditional chemotherapy. Patients and healthcare providers increasingly prefer targeted therapies due to their ability to selectively attack cancer cells while sparing healthy tissues, leading to higher demand for these drugs.
