Abstracts

According to this study, the global Targeted Resequencing Service market size will reach US\$ 3340 million by 2031.

Targeted Resequencing Service is a high-precision sequencing approach that focuses on specific genes, genomic regions, or functional elements of interest using next-generation sequencing (NGS) technologies. This service is widely used in disease-associated variant detection, pharmacogenomics, biomarker discovery, cancer profiling, and genetic screening. Target enrichment methods such as hybrid capture, PCR amplification, or CRISPR-based selection are used to isolate the regions of interest, followed by high-throughput sequencing and bioinformatics analysis. Compared to whole-genome or whole-exome sequencing, targeted resequencing offers smaller data volumes, lower costs, higher coverage depth, and greater sensitivity—making it ideal for identifying low-frequency mutations or analyzing specific genes across large sample sets. Target panels can be custom-designed to include dozens to thousands of genes, supporting both individual and multiplexed sample analysis. This service delivers efficient, cost-effective, and clinically meaningful insights, serving as a powerful tool for precision medicine and molecular diagnostics.

United States market for Targeted Resequencing Service is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
