Taste-modifying agents, also known as taste modifiers, are substances or compounds that alter the perception of taste in the human palate. These agents can modify the taste of various foods and beverages by interacting with taste receptors on the tongue, thereby enhancing, suppressing, or altering the perception of specific taste qualities. Taste modification is often used in the food and beverage industry to improve the flavor profile of products or create novel taste experiences.

There is a growing demand for natural ingredients in the food and beverage industry. As a result, the development of natural taste modifiers derived from plant sources, herbs, and spices is becoming more prominent. These modifiers can enhance flavors while meeting consumer preferences for clean label products.
