Taxol is a chemotherapy medication primarily used to treat various types of cancer. Its active ingredient is paclitaxel, which is derived from the bark of the Pacific yew tree (*Taxus brevifolia*) or, more commonly, synthesized in the laboratory. Taxol works by interfering with the growth and division of cancer cells. Specifically, it binds to tubulin, a protein involved in cell division, and stabilizes microtubules, preventing them from breaking down. This disruption in microtubule dynamics ultimately leads to cell cycle arrest and apoptosis (programmed cell death) in cancer cells. Taxol is used to treat a variety of cancers, including breast cancer, ovarian cancer, lung cancer, and Kaposi's sarcoma. It is typically administered intravenously by a healthcare professional in a clinical setting. While Taxol can be effective in treating cancer, it may also cause side effects, including hair loss, nausea, vomiting, diarrhea, neuropathy (nerve damage), and bone marrow suppression. The severity and type of side effects experienced can vary from person to person.

The global Taxol market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
