The global TDI Trimer market size is predicted to grow from US\$ 122 million in 2025 to US\$ 164 million in 2032; it is expected to grow at a CAGR of 4.3% from 2026 to 2032.

TDI trimer is an aromatic polyisocyanate curing agent produced through the catalytic trimerization of toluene diisocyanate (TDI). Its molecular structure typically contains an isocyanurate ring and multiple reactive isocyanate groups, enabling it to react with hydroxyl-functional resins, polyester polyols, acrylic polyols, alkyd resins, polyether polyols, and other active-hydrogen-containing systems to form crosslinked polyurethane networks. Commercial TDI trimer products are commonly supplied as solvent-borne liquid hardeners, low free-TDI grades, high-solids grades, or blended polyisocyanate curing agents. Key product specifications include NCO content, solid content, free TDI monomer level, viscosity, color, solvent composition, storage stability, resin compatibility, and application performance. This research focuses on TDI isocyanurate-type trimer products used in two-component polyurethane coatings, wood coatings, industrial coatings, adhesives, leather finishing, inks, and selected elastomer systems, where they function primarily as crosslinkers and hardeners to improve film hardness, drying speed, chemical resistance, adhesion, and mechanical performance.

Based on our research, the TDI trimer industry is best understood as a mature niche segment within the polyurethane hardener and polyisocyanate curing agent market, rather than a simple extension of the TDI monomer business. Its core value comes from the isocyanurate-type aromatic polyisocyanate structure formed through TDI trimerization, which enables crosslinking with hydroxyl-functional resins, polyols, and other active-hydrogen-containing systems. This gives TDI trimer important performance advantages in hardness development, drying speed, solvent resistance, adhesion, and mechanical strength. Compared with aliphatic or cycloaliphatic polyisocyanates such as HDI trimer and IPDI trimer, TDI trimer is generally more cost-effective and reactive, but it is weaker in non-yellowing performance, outdoor weatherability, and occupational

health positioning. As a result, its core applications are concentrated in wood coatings, general industrial coatings, adhesives, leather finishing, inks, and cost-sensitive two-component polyurethane systems, rather than premium outdoor coatings or high-end automotive coatings.

From a supply perspective, the TDI trimer market is less transparent than the HDI trimer market or the broader isocyanate industry. A large number of product listings in the market come from hardener suppliers, compounders, distributors, and repackagers, so supplier screening must distinguish genuine producers from trading companies. Companies with stronger evidence for TDI trimer or TDI-based isocyanurate products include Shaoguan Dongsan Synthetic Material, Wuhan Shiquanxing New Material Technology, SAPICI / Sun Chemical, and Wanhua Chemical as a relevant isocyanate leader with related HDI-TDI polyisocyanate product lines requiring further grade-level verification. Dongsan and Shiquanxing currently have more direct public product evidence, while SAPICI has stronger evidence in aromatic TDI-based isocyanurate and mixed TDI/HDI isocyanurate systems. By contrast, Covestro, Tosoh, Mitsui Chemicals, and Asahi Kasei should be treated more cautiously under the narrow TDI trimer scope, because public evidence more clearly supports their positions in HDI trimers, IPDI systems, TDI monomers, special isocyanates, or adjacent polyisocyanate products rather than confirmed TDI trimer grades.

From a demand perspective, TDI trimer remains closely tied to traditional two-component polyurethane applications, particularly wood coatings, furniture coatings, general industrial coatings, adhesives, leather finishing, and selected ink or elastomer systems. China is an important market because its furniture, wood coating, polyurethane hardener, and regional coating supply chains are relatively complete, supporting a large number of local hardener producers and formulators. In Europe, Japan, and North America, demand is more shaped by low free-monomer requirements, labeling compliance, occupational exposure control, and the gradual shift toward higher-performance or lower-emission alternatives. As the coatings industry moves toward lower VOC, waterborne systems, high-solids formulations, and lower residual monomer content, TDI trimer is unlikely to show aggressive volume growth. Instead, demand will increasingly favor low free-TDI grades, high-solids products, modified blends, and customer-specific hardener solutions.

From a competitive trend perspective, the industry is moving away from simple price competition toward a more capability-driven model. Key differentiators will include free TDI monomer reduction, NCO stability, resin compatibility, solvent system optimization, color and viscosity control, low-VOC formulation support, and application-level technical

service. Standard TDI trimer grades will continue to serve cost-sensitive wood coating and general industrial coating markets, but higher-end customers will increasingly evaluate suppliers based on safety, stability, compliance documentation, and formulation support. Genuine manufacturers with trimerization process control, post-treatment capability, and batch consistency will be better positioned than pure distributors or repackagers. Overall, TDI trimer should be viewed as a mature but still relevant polyurethane hardener segment, with moderate growth and meaningful product-upgrade opportunities in low-monomer, high-solids, modified, and application-specific grades.
