Tetrakis (dimethylamino) hafnium (TDMAH) is an organometallic compound composed of a central hafnium atom (Hf) and four surrounding dimethylamino ligands (NMe₂). The physical and chemical properties of four (dimethylamino) hafnium compounds are suitable for CVD and ALD, and they are a class of materials that are increasingly being studied as precursors for depositing hafnium. Hafnium oxygen thin film is likely to be used as a candidate high dielectric constant insulating layer material in COMS and next-generation DRAM. Usually, CVD or ALD are used to obtain hafnium oxide thin films. Firstly, a gas-phase hafnium precursor is introduced and attached to the wafer surface for chemical reactions.
