## Abstracts

The global Technical Grade Sodium Metasilicate market size is predicted to grow from US\$ 2060 million in 2025 to US\$ 2831 million in 2032; it is expected to grow at a CAGR of 4.7% from 2026 to 2032.

Technical Grade Sodium Metasilicate is an industrial alkaline chemical widely used in detergents, paper and pulp processing, textile desizing, metal surface cleaning, ceramics, and industrial water treatment. In 2024, the global average price is approximately US\$0.21 per kilogram, with worldwide production reaching around 9.8 million tons. Gross margins typically range from 12%–25%, influenced by soda ash cost, energy consumption, hydration state, and bulk transport logistics. The supply chain includes upstream soda ash, silica, and thermal processing equipment; midstream manufacturers produce anhydrous and pentahydrate technical grades through high-temperature synthesis, drying, granulation, and bulk packaging; downstream applications span detergent manufacturing, industrial cleaning agents, pulp and paper mills, ceramic production, textile finishing, and water treatment plants.

Demand for technical grade sodium metasilicate continues to grow steadily as detergent manufacturers, pulp and paper mills and industrial cleaning chemical producers expand usage of alkaline builders. Substitution with environmentally compliant surfactant systems and water-reduction technologies will slightly moderate growth, but strong demand in Asia's industrial sectors and the recovery of ceramic and textile processing keep the market on a stable 4–5% CAGR trajectory toward 2031.
