Telecommunications software is any type of software package that aids in the process of electronic communications, especially those that involve the transmission of audio in some manner. There are many different types of software designed to handle telecommunication functions in various settings, ranging from simple software that is installed and utilized by an end user, to the software that is necessary to drive the function of entire networks. Telecom services now include fixed-network services (data retail, Internet retail, voice retail and wholesale) and mobile services.

Fixed-data services — Includes all dedicated/private line, packet and circuit-switched access services (for example, frame relay, asynchronous transfer mode, IP, Integrated Services Digital Network, DSL, multichannel multipoint distribution service [MMDS] and satellite) retail revenue. No differentiation is made between the type of traffic or application carried by these services. All types of transmissions — nonvoice data, image, video, fax, interactive services and even voice — can be carried by these services regardless of whether the source format is analog or digital. All revenue reflects service provider annualized retail revenue — paid for by the business and residential end user of the service; no wholesale or carrier-to-carrier revenue is included.
