Teleportation is referred to as the process of transfer of energy or matter between two distinctive points. The process also includes the transfer of matter or energy without passing through the physical space between these points. Teleportation technology is widely used in the media and broadcasting industry, and the whole technology depends on the base of ICT infrastructure. A typical process flow for the teleportation technology includes a message generated by the information generator, which is encoded and teleported via satellite communication channels to the receiver at the other end. The receiver decodes the information and accesses the message sent by the sender.
