Teleradiology consulting service is a service model that uses information technology to transmit radiological image data from one location to another for diagnosis and consultation by remote radiologists or experts. Primary medical institutions use digital imaging equipment (such as CT, MRI, X-ray machines, etc.) to obtain patients' radiological image data, and then transmit these data to remote radiological consultation service centers or medical institutions where experts are located through dedicated medical image transmission systems or network platforms. For remote areas or areas with scarce medical resources, local medical institutions may lack professional radiologists or advanced diagnostic equipment. Teleradiology consultation services allow patients in these areas to enjoy expert diagnostic services from distant large cities or professional medical institutions, improve the accessibility of medical resources, and help solve the problem of uneven distribution of medical resources.
