The report requires updating with new data and is sent in 48 hours after order is placed.

For routine transmission electron microscopy (TEM), it is generally accepted that specimens should be thin, dry and contain molecules which diffract electrons. Biological specimens, which are large and consist of large amounts of water, also do not defract electrons and are therefore difficult to see in the TEM. Preparing biological specimens for the TEM, whilst retaining the structural morphology of the material, is a challenge.
