A temperature calibrator is a special instrument used to measure and calibrate temperature. It verifies the accuracy and reliability of a temperature sensor by comparing the temperature difference between a standard element with a known temperature and the temperature element to be calibrated. Temperature calibrators are widely used in equipment and environments that require precise temperature control, such as thermometers, ovens, refrigerators, air conditioners, and various industrial production lines. Its basic principle is based on the law of heat conduction, and the temperature sensor is calibrated by precisely controlling the temperature standard element.

The global Temperature Calibrator market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
