Temperature regulating fibers are advanced textile materials designed to maintain a consistent temperature by managing heat transfer between the body and the environment. These fibers incorporate phase change materials (PCMs), which absorb, store, and release heat as they change from solid to liquid and vice versa. When the body temperature rises, the PCMs within the fibers absorb excess heat and undergo a phase change, which helps cool the body. Conversely, when the body temperature drops, the stored heat is released, providing warmth. This dynamic process allows temperature-regulating fibers to create a microclimate that keeps the wearer comfortable in varying environmental conditions. These fibers are commonly used in clothing, bedding, and athletic wear, offering enhanced comfort and performance by adapting to the wearer's thermal needs.

The global Temperature Regulating Fibres market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
