## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

The global Temporary Bonding and Debonding Systems market size is projected to grow from US\$ million in 2022 to US\$ million in 2029; it is expected to grow at a CAGR of % from 2023 to 2029.

The Asia Pacific region was expected to experience the fastest growth in the temporary bonding and debonding systems market, primarily due to the increasing demand for advanced packaging technologies in countries such as China, Japan, South Korea, and Taiwan. The growth of the semiconductor industry in the region and the increasing adoption of IoT and AI technologies were the major factors driving the market.

Temporary bonding and debonding systems are technologies used in the semiconductor manufacturing process to temporarily bond a thinned wafer onto a rigid carrier substrate for further processing, and then to debond it after the processing is complete. Temporary bonding is necessary for advanced packaging technologies, such as 3D ICs (Integrated Circuits), wafer-level packaging, and system-in-package, where thinned wafers need to be transferred to different processing tools without damaging them. Temporary bonding systems use adhesives or other materials to bond the thinned wafer to a carrier substrate, which allows for handling, processing, and testing of the wafer. Debonding systems are used to remove the thinned wafer from the carrier substrate without damaging it or its features. The debonding process can use mechanical, thermal, or chemical methods depending on the materials and adhesives used in the temporary bonding process.
