Abstracts

The global Temporary Cardiac Stimulation Lead market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

A temporary cardiac stimulation lead is a thin, flexible wire that is temporarily inserted into the heart to deliver electrical impulses to regulate the heart's rhythm. This type of lead is typically used in emergency situations or during temporary procedures, such as during surgery or while waiting for a permanent pacemaker to be implanted. Temporary cardiac stimulation leads are designed to be easily inserted and removed, and are not meant for long-term use.

The temporary cardiac stimulation lead has several advantages, including its ability to provide immediate pacing support to patients with bradycardia or heart block, its easy insertion and removal compared to permanent pacemakers, and its cost-effective use in the hospital setting. However, it also has disadvantages such as the risk of infection at the insertion site, the need for continuous monitoring to ensure proper lead positioning and function, and the limited duration of use due to the temporary nature of the lead. Additionally, there is a potential for lead displacement or malfunction, which can require urgent intervention.
