The global Tenotomy Scissors market size is predicted to grow from US$ 44 million in 2025 to US$ 55.8 million in 2031; it is expected to grow at a CAGR of 4.0% from 2025 to 2031.

Tenotomy scissors are surgical scissors used to perform delicate surgery. They can be straight or curved, and blunt or sharp, depending upon necessity. This equipment can be used in many surgical specialties, in particular delicate operations in ophthalmic surgery, oral and maxillofacial surgery, or in neurosurgery.

Tenotomy scissors are a medical device used in surgery, specifically for cutting tendons. Tendons are bands of connective tissue that connect muscles to bones, and they play an important role in the body's movement and postural control. In some cases, tendons may become overly tense or stiff from injury or other causes, resulting in limited or painful joint motion. Tenotomy surgery can be done by using tenotomy scissors to cut open the tendon to relieve tension or restore normal range of motion to the joint. In some cases, a tendon graft may be necessary, such as during ACL reconstruction surgery. Tenotomy scissors can be used to cut and manipulate the grafted tendon.
