The TENS (transcutaneous electrical nerve stimulation) pain management unit is a non-invasive, non-drug analgesic device that transmits low-frequency pulse current to stimulate nerve endings through electrodes on the skin surface. Its core principle is based on the gate control theory. It applies current of specific intensity and frequency to the human body through electrodes, selectively activating non-noxious afferent nerves (such as high-frequency, low-intensity stimulation) or noxious fibers (such as low-frequency, high-intensity stimulation) to interfere with pain signal transmission, promote the release of endogenous opioid peptides, improve local blood circulation or relieve muscle spasms, ultimately achieving the effect of relieving acute and chronic pain. It has the advantages of simple operation, high safety, and no risk of drug dependence.
