Tensile architecture is a structural system that predominantly uses tension instead of compression. Tensile and tension are often used interchangeably. Other names include tension membrane architecture, fabric architecture, tension structures, and lightweight tension structures. A tensile fabric structure is characterized by the tensioning of a fabric membrane system, using cables, wires, steel or any other form of support system. By tensioning the fabric, not only are creases eliminated, creating a clean appearance, but the material is also fortified to withstand weather conditions or potential damage.

The global Tensile Architecture market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
