Terminal sterilization is usually applied to various commodity health products (surgical drapes, gowns, etc.) and implantable medical devices (bare metal stents, heart valves, vascular closure devices, etc.) and products used during implant surgery (catheters, guides, etc.) Silk etc.). Terminal sterilization is also often used to process combined products, where equipment, drugs, and/or biological agents are combined on a single product. High patient safety, strict standards, routine process control, and low-cost manufacturing are attractive aspects of terminal sterilization. As the field of combination products continues to expand and evolve, there are opportunities to extend terminal sterilization applications to new combination products. Material compatibility challenges must be overcome to realize these opportunities.
