The global Tertiary Ammonia Filtration market size is predicted to grow from US$ 32.5 million in 2025 to US$ 45.3 million in 2031; it is expected to grow at a CAGR of 5.7% from 2025 to 2031.

Tertiary ammonia filtration, also known as amine tertiary filter, is an advanced water treatment system that employs amine-based chemicals to selectively react with and remove ammonia nitrogen from wastewater. It plays a vital role in the tertiary treatment stage to comply with stringent environmental discharge standards. This system effectively reduces the levels of ammonia nitrogen, thus preventing eutrophication in water bodies and protecting the ecological environment. Operating on the principle of selective adsorption and conversion of ammonia nitrogen into biodegradable products by the amine solution, it circumvents the complexities of traditional biological nitrogen removal processes. The tertiary ammonia filtration system is distinguished by its operational simplicity, high removal efficiency, and adaptability, significantly improving the overall wastewater treatment effectiveness and providing a reliable basis for water resource recycling, which is a crucial technological approach for achieving sustainable development.

United States market for Tertiary Ammonia Filtration is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Tertiary Ammonia Filtration is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

Europe market for Tertiary Ammonia Filtration is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
