The research report highlights the growth potential of the global Test and Burn-in Sockets market. Test and Burn-in Sockets are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of Test and Burn-in Sockets. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Test and Burn-in Sockets market.

There are two important tests in semiconductor manufacturing. One is the wafer test during the wafer process, in which electrical characteristics of chips are tested before dicing a wafer into many pieces of semiconductor (called dies or chips). The other is the final test during the assembly and testing process, which is conducted after packaging the diced chips.

An IC socket is used in the final test. It plays the crucial role of connecting the device and the tester, just as a probe card does in the wafer test (see the figure below).

Depending on the purpose of the test, IC sockets are categorized into two groups: burn-in sockets for testing reliability, including durability, and test sockets for measuring

electrical characteristics. Although these two types are both generally referred to as IC sockets, the required performance varies depending on the difference in use.

The main producers in the industry are Yamaichi Electronics, Cohu and Enplas, which accounted for 12%, 10% and 9% of revenues respectively. By region, consumption in the Asia-Pacific region is the highest, at more than 67 percent.
