Test Tube Heater provides a safe, dry and constant temperature environment for the substances in the test tube, and is often used in laboratories and hospitals.

A test tube heater is a device used to heat test tubes in a laboratory. It is commonly used to heat liquids or reagents to specific temperatures in chemistry experiments, biology experiments, and other scientific experiments. Tube warmers are usually made of metal or ceramic material and have a stand or base on which to place the test tubes. The top of the heater has a heating element that can be powered by the mains for heating. Some tube heaters also have temperature controllers that allow you to adjust the heating temperature to ensure that the liquid in the tube remains within the desired temperature range.
