Tetanus antitoxin used for the prevention and treatment of tetanus. When tetanus or its suspicious symptoms appear, antitoxin therapy should be used in a timely manner in conjunction with surgical treatment and other therapies. When open wounds (especially deep wounds and severe pollution) are at risk of tetanus infection, timely preventive measures should be taken. Those who have been immunized against tetanus toxoid should be given another shot of toxoid to strengthen immunity after injury. Antitoxin prophylaxis should be administered to those who have not been immunized against toxoid or who have not had a clear history of immunity.
