Single-line production capacity was approximately 2,000 tons per year, with an average gross profit margin of about 20%. Tetramethylol Acetylenediurea is a chemical intermediate and a derivative of glycourea. It contains four hydroxymethyl groups and is mainly used as a crosslinking agent or modifier in the synthesis of polymer materials. It appears as white or pale yellow crystals and is widely used in the coatings, paints, and textile industries.

The upstream raw materials for Tetramethylol Acetylenediurea primarily include glycourea and formaldehyde, synthesized through a hydroxymethylation reaction. Downstream applications of this compound are mainly in the textile industry as a durable heat-pressing finishing agent to enhance the wrinkle resistance of fabrics. Simultaneously, it is also an important crosslinking agent component in the coatings and paints industry, capable of reacting with hydroxyl groups and other groups in resins to form a dense network structure, significantly improving the hardness, chemical resistance, and gloss of the coating.

United States market for Tetramethylol Acetylenediurea is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
