TEV Protease, short for Tobacco Etch Virus protease, is an enzyme derived from the Tobacco Etch Virus that specifically cleaves after a sequence of Asp-Glu-His-Asp (DEHD) in peptide bonds. It is widely used in molecular biology and biotechnology for the removal of fusion tags from recombinant proteins, a process known as protein cleavage and purification. TEV Protease is also utilized in structural biology to study protein structures by generating specific peptide fragments for X-ray crystallography or cryo-electron microscopy. Its unique specificity and efficiency make it a valuable tool in the biomedical and biotechnology fields.

The global TEV Protease market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
