The global Textile Mechanical Recycling market size is predicted to grow from US$ 2057 million in 2025 to US$ 2776 million in 2032; it is expected to grow at a CAGR of 4.5% from 2026 to 2032.

Textile mechanical recycling is a process that involves the mechanical breakdown of used textiles into fibers or other usable materials without the use of chemical agents (or with minimal chemical input). In this process, collected post - consumer or post - industrial textiles are first sorted according to their types, colors, and fiber compositions. Then, they are shredded into smaller pieces using mechanical shredders. These shredded materials are further processed through techniques such as carding, opening, and spinning to transform them into new fibers or yarns, which can be used to manufacture new textile products. This approach aims to reduce textile waste, conserve natural resources, and minimize the environmental impact associated with the textile industry.

United States market for Textile Mechanical Recycling is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
