## Abstracts

The global Textile Reinforced Conveyor Belts market size is predicted to grow from US\$ 3867 million in 2025 to US\$ 5145 million in 2031; it is expected to grow at a CAGR of 4.9% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Textile reinforced conveyor belts are a type of conveyor belt that utilize layers of woven fabric (textile plies) as reinforcement materials to provide strength, flexibility, and durability. These belts are primarily composed of a rubber matrix bonded with textile reinforcements made from materials such as polyester, nylon (polyamide), or aramid. The textile plies are embedded in rubber to withstand mechanical stress and provide resistance against wear, impact, and elongation. Textile reinforced conveyor belts are commonly used in industries such as mining, cement, steel, power generation, and agriculture for transporting bulk materials like coal, ore, aggregates, and grains. Their advantages include lightweight construction, ease of maintenance, high tensile strength, and cost-effectiveness compared to steel-cord reinforced alternatives.

Textile reinforced conveyor belts typically feature tensile strengths ranging from 160 to 3150 N/mm, with common constructions including 2 to 6 fabric plies made from EP (polyester/nylon), NN (nylon/nylon), or CC (cotton/cotton) materials. Cover thicknesses vary from 2 to 10 mm on the top and 1 to 6 mm on the bottom, depending on the abrasion and load demands. These belts are available in standard widths from 300 mm to 2200 mm and can operate within temperature ranges of -10°C to +80°C for standard types, with specialized grades handling up to +200°C (heat-resistant) or down to -60°C

(cold-resistant). Cover grades such as M24, N17, HR, FR, and OR are chosen based on resistance to wear, heat, flame, or oil, while elongation at break is typically below 1.5% to ensure dimensional stability. These parameters make them suitable for industries like mining, cement, agriculture, and logistics.
