The global Textile Thermal Resistance Tester market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

A textile thermal resistance tester is a device used to measure the thermal resistance (also known as thermal insulation) of textile materials, such as fabrics and clothing. This testing helps evaluate how well a fabric can retain heat, which is crucial for assessing comfort, warmth, and performance in various applications, especially in clothing and outdoor gear. The tester typically involves placing a fabric sample between two plates—one heated and one at a lower temperature—and measuring the temperature difference across the fabric after a specific period. The results indicate the material's ability to resist heat flow, which can inform product development and quality control in the textile industry.
