The global TFT LCD Display market size is predicted to grow from US\$ 111160 million in 2025 to US\$ 134410 million in 2031; it is expected to grow at a CAGR of 3.2% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

TFT LCD is a type of LCD that provides better optical properties such as picture contrast. TFT LCDs form the display panel for LCD TVs, desktop PCs, and mobile computing devices. An LCD panel is made up of a number of layers containing different components such as a polarizer, a color filter, and an LCD glass substrate. The LCD glass substrates used in display devices are very thin (0.3-0.7 mm).

The reduced thickness of LCD glass substrates is leading vendors to focus on manufacturing slimmer and lightweight devices. In the past, manufacturing thin LCD glass was expensive. However, currently slim TFT LCDs are easily available in the market, which enable the manufacture of thin LCD glass substrates. Corning introduced its EAGLE XG glass substrate, which excludes heavy metals such as barium, arsenic, halogen compounds, and antimony, making it eco-friendly and cost-efficient. The LCD module can also be reduced up to 10% by reducing the thickness.
