The global Thallium Doped Sodium Iodide NaI(Tl) market size is predicted to grow from US\$ 29.16 million in 2025 to US\$ 41.94 million in 2032; it is expected to grow at a CAGR of 5.4% from 2026 to 2032.

Thallium, NaI(Tl) is added to sodium iodide crystals. When exposed to ionizing radiation, it will emit photons (scintillation), so it is used in scintillation detectors, traditional nuclear medicine, geophysics, nuclear physics, and environmental measurements. . NaI(Tl) is the most widely used scintillation material and has the highest light output. Sodium iodide crystals are usually attached to a photomultiplier tube and sealed in a sealed unit because of the deliquescent nature of sodium iodide. Crystal growth under different conditions can be obtained by fine-tuning some parameters (such as radiation hardness, afterglow, and transparency). When the ratio of additives in the crystal is high, it can be used in X-ray detectors with high spectral quality. Sodium iodide is available as both single and polycrystalline in this application.

The NaI(Tl) scintillation crystal market caters to the demand for scintillator materials used in radiation detection, medical imaging, and nuclear research applications. NaI(Tl) crystals offer high light yield, good energy resolution, versatility, and cost-effectiveness, making them suitable for various industries. The market is driven by the need for accurate radiation detection, medical imaging advancements, and nuclear research requirements.
