## Abstracts

The global Therapeutic Radioligands market size is predicted to grow from US\$ 2235 million in 2025 to US\$ 6997 million in 2032; it is expected to grow at a CAGR of 18.1% from 2026 to 2032.

Therapeutic Radioligands is a type of targeted cancer therapy that combines the specificity of monoclonal antibodies with the destructive power of radiation. The treatment involves attaching radioactive isotopes to monoclonal antibodies, which are specialized proteins that can recognize and bind to specific antigens found on the surface of cancer cells.

The key drivers of the radioimmunotherapy market is its potential to deliver highly targeted and precise treatment to cancer cells, sparing healthy tissues and reducing side effects compared to traditional radiation therapies. The ability of RIT to offer personalized treatment options based on specific cancer biomarkers further enhances its appeal in the field of precision medicine. However, the radioimmunotherapy market also faces challenges. One major challenge is the high cost associated with the development and production of radiopharmaceuticals, limiting access for some patients and healthcare systems. Additionally, navigating complex regulatory pathways for approval and reimbursement of RIT products can be time-consuming and resource-intensive for pharmaceutical companies. Furthermore, there may be limited awareness and acceptance of RIT among healthcare professionals and patients, leading to slower adoption rates and market penetration. Addressing these challenges requires continued research and investment in RIT technologies to improve efficacy and cost-effectiveness. Collaborations between pharmaceutical companies, research institutions, and healthcare organizations can facilitate knowledge-sharing and streamline the regulatory process.
