Therapeutic recombinant proteins are proteins that are produced by recombinant DNA technology and are used as drugs to treat various medical conditions. Recombinant DNA technology involves the use of genetically engineered microorganisms or cells to produce large quantities of a specific protein that has therapeutic potential. Therapeutic recombinant proteins are used to treat a wide range of medical conditions, including

cancer, autoimmune diseases, genetic disorders, and infectious diseases. These proteins are designed to mimic the natural proteins in the body that regulate various biological processes. They are often administered by injection, and their effectiveness depends on the specific protein and the medical condition being treated.
