The global Thermal ALD System market size is predicted to grow from US\$ 2446 million in 2025 to US\$ 4896 million in 2032; it is expected to grow at a CAGR of 10.5% from 2026 to 2032.

In 2025, global production capacity for thermal ALD systems is approximately 1,850 units, with actual production reaching around 1,562 units. The average global selling price is about US\$ 1.6 million per unit, while gross margins generally range from 45% to 55%, reflecting strong process differentiation and high customer switching costs. A Thermal Atomic Layer Deposition (ALD) System is a semiconductor thin-film deposition tool that utilizes self-limiting surface chemical reactions to deposit ultra-thin films with atomic-scale thickness control. Unlike plasma-enhanced ALD, thermal ALD relies solely on thermal energy to drive surface reactions between sequentially pulsed precursors. This approach enables excellent film uniformity, precise thickness control, and outstanding conformality, particularly in high-aspect-ratio structures. Thermal ALD systems are widely used for depositing high-k dielectrics, metal oxides, nitrides, and barrier layers in advanced logic, memory, power devices, and 3D semiconductor architectures.

The upstream of the thermal ALD system industry chain includes high-purity chemical precursors, carrier and purge gases, precision gas delivery modules, vacuum systems, temperature control units, and chamber materials with high chemical stability. The midstream focuses on equipment design and manufacturing, including reactor architecture, precursor dosing accuracy, thermal uniformity control, contamination management, and process automation?representing the core value and technological differentiation. Downstream customers consist of logic foundries, memory manufacturers (DRAM and NAND), power semiconductor producers, and advanced packaging fabs. The industry chain further extends to process development support, consumables supply, chamber maintenance, and long-term service contracts.

The thermal ALD system market continues to expand as device scaling and 3D architectures drive demand for atomic-level process control. In advanced logic and memory manufacturing, increasingly complex structures such as FinFETs, GAA transistors, and 3D NAND require ultra-thin, highly conformal films that thermal ALD is uniquely suited to deliver.

Compared with plasma-enhanced approaches, thermal ALD offers superior film quality and lower damage, making it especially attractive for sensitive interfaces and critical dielectric layers. In addition, the growing adoption of high-k materials and advanced barrier layers increases process steps per wafer, directly supporting equipment demand. Although cycle times are relatively longer, ongoing improvements in batch processing and productivity optimization are mitigating throughput limitations. Supported by sustained investment in advanced semiconductor nodes and power devices, the thermal ALD market is expected to maintain steady, high-quality growth over the medium to long term.
