Thermal emission scanning electron microscope is a high-resolution imaging device that uses a hot cathode to emit an electron beam, which is focused and accelerated to scan the sample surface, and generates sample surface morphology and structural information by detecting various physical signals (such as secondary electrons, backscattered electrons, etc.) generated by the interaction between the electron beam and the sample.

Thermal emission scanning electron microscopes are widely used in materials science, chemistry, physics, biology, medicine and other fields. They are used for material micromorphology, organization, composition analysis, material fracture analysis and failure analysis, as well as detailed structural observation of biological samples.

The global Thermal Emission Scanning Electron Microscope market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
