A Thermal Performance Tester is a specialized instrument used to measure the thermal properties of materials or devices, primarily acquiring key thermal parameters such as thermal conductivity, thermal diffusivity, specific heat capacity, and thermal resistance. It typically uses contact or non-contact sensors, a heating source, and a data acquisition system to precisely measure the thermal conduction and heat storage characteristics of samples under different temperatures or environmental conditions. Thermal parameter analyzers are widely used in fields such as heat dissipation analysis of electronic devices, thermal performance evaluation of building materials, energy materials research, and industrial production process optimization, providing a scientific basis for thermal management design, material development, and performance optimization. Sales in 2025 were 185,000 units, with an average price of \$525 per unit. Total production capacity was 230,000 units, with a gross profit margin of 42%.
