Thermal reflective foil is a material used in housing and body insulation to reduce radiant heat transfer. This material works by cutting off some of the electromagnetic waves (radiant heat) from the sun, similar to the cooler feeling experienced when moving from sunlight to shade.

Of the three types of heat transfer (radiation, conduction, and convection), thermal reflective foil primarily cuts out radiant heat. This results in comfortable, cooler environments in summer and warm interiors in winter without heat escaping the room.

The global Thermal Reflective Foil market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
