According to our (LP Info Research) latest study, the global Thermal Spray Coatings for Semiconductor Equipment market size was valued at US\$ 23 million in 2022. With growing demand in downstream market and recovery from influence of COVID-19 and the Russia-Ukraine War, the Thermal Spray Coatings for Semiconductor Equipment is forecast to a readjusted size of US\$ 36 million by 2029 with a CAGR of 6.5% during review period.

The research report highlights the growth potential of the global Thermal Spray Coatings for Semiconductor Equipment market. With recovery from influence of COVID-19 and the Russia-Ukraine War, Thermal Spray Coatings for Semiconductor Equipment are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of Thermal Spray Coatings for Semiconductor Equipment. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Thermal Spray Coatings for Semiconductor Equipment market.

Chamber particles can reduce the yield of functioning devices on a semiconductor wafer. Thermal spray coatings are applied to PVD chamber shielding components to roughen process surfaces, promote adhesion of process materials and thereby reduce defect density within the components respective process chambers.

Dry etching is an essential nanofabrication technique in the modern-day manufacturing

of miniaturized semiconductor devices. The semiconductors undergo physical bombardment by argon ions in dry-etch chambers for selectively removing masked patterns of semiconductor materials. The atmosphere in dry-etch chambers is highly corrosive and involves halogen-containing gases such as fluorine and chlorine that get broken down by plasma into chemically reactive radicals. The process gases and the removed material pose a potential risk of deposition onto the chamber components such as walls, liners, and process kits. To meet these challenges, the etch chambers require internal wear and corrosion-resistant coatings to protect them from the corrosive gases that could otherwise prove detrimental to plasma chamber components and their performance. On the other hand, the particle dropout from chamber walls due to ion bombardment also risks contaminating the etched wafer, causing undesirable process drift.
