The global Thermal Spray Molybdenum Wire market size is predicted to grow from US\$ 124 million in 2025 to US\$ 176 million in 2032; it is expected to grow at a CAGR of 5.2% from 2026 to 2032.

Thermal Spray Molybdenum Wire refers to molybdenum (Mo) wire specifically intended for use in thermal spray processes. Thermal spraying is a surface engineering technology that involves melting and projecting particles of a material onto a substrate to form a coating. In the case of molybdenum wire, it is heated to a molten state and then sprayed onto the surface to be coated.

The development trend of thermal sprayed molybdenum wire is moving towards high performance, green environmental protection and diversified applications. With the advancement of science and technology, molybdenum wire materials and their spraying processes are constantly optimized to improve the wear resistance, corrosion resistance and high temperature stability of the coating to meet more stringent industrial needs. At the same time, the industry's concern for environmental protection has prompted the development of more environmentally friendly spraying technologies to reduce the emission of harmful substances. In addition, with the rise of emerging industries and the increasing demand for upgrading of traditional industries, the application areas of thermal sprayed molybdenum wire are also continuing to expand. From aerospace, automobile manufacturing to petrochemicals and many other fields, its market demand is expected to continue to grow, promoting related technology and product innovation
