Thermally conductive gel is a soft one-component silicone-based thermally conductive gel with high thermal conductivity, low interfacial thermal resistance and good thixotropy. Thermally conductive gel is an ideal material for applications with large gap tolerances. It is filled between the electronic components to be cooled and the heat sink/housing, etc., making them in close contact, reducing the thermal resistance, and quickly and effectively reducing the temperature of the electronic components, thereby extending the life of the electronic components and improving their reliability.
