The report requires updating with new data and is sent in 48 hours after order is placed.

Thermochromic materials change reversibly with changes in temperature. Using metal compounds or liquid crystals they can be made as semi- conductor compounds. The change in color happens at a determined temperature, which can be varied fixing the material. On the basis of product type the global thermochromic market can be segmented into irreversible and reversible materials. Reversible materials is preferred over the irreversible materials. They do not have the ability to return to their original state therefore are widely used in baby products and chemical containers market.
